

Types of Line Configuration / Coding :-

In P2P, a link is shared b/w two devices only

- ① Point to Point Configuration / Connection / Coding
Example :- Mesh Topology, Ring Topology, Star Topology
- ② Multipoint Configuration
Example :- Bus Topology.

11/5/2024

Transmission Delay $\{T_d = \frac{L}{B}\}$

Extra:-

$\{T_d = \frac{L}{B}\} \rightarrow$ Time taken for putting packet/frame on outgoing link is transmission delay $\{T_d\}$

$\{P_d = \frac{d}{\text{speed}}\} \rightarrow$ Time taken to take data from one point to other is Propagation delay $\{P_d\}$ / Propagation Time.

$\{TT = T_d + P_d\}$

Total Time

If in a network a device is connected to all other devices in point to point manner then it is known as peer to peer connection example: Fully Mesh Network

- In Multipoint Coding, a link is shared between several devices.

Topology \rightarrow means Layout

Categories

Physical Topology
works at Physical Layer

Logical Topology
works at Network Layer

Graphical Representation of how devices are connected to each other is termed as Topology
OR
Logical or Physical arrangement of network (Computers/nodes) is termed as Topology

Types of Topologies {5}

Fundamental or Basic Topologies

- Mesh Topology

- Ring Topology

- Star Topology

- Bus Topology

- Tree or Hybrid Topology

Point to Point Coding

Common LAN Topologies

Multipoint Configuration.

Mesh Topology

$n = \text{no. of devices}$

① No. of I/O Ports \rightarrow

- for each device $\rightarrow (n-1)$

- for whole Network $\Rightarrow \{n(n-1)\}$

Q \Rightarrow ABC corporation of XYZ has a fully connected mesh network consisting of 99 devices. Calculate no. of ports of each device.
{RPSC Programmer 2013}

$\Rightarrow n = 99$

no. of ports on each device $\rightarrow \underline{98}$

Q \Rightarrow Assume six devices are arranged in a fully connected mesh topology. How many I/O ports must each device have?
{BSPHCL JE Electrical 2019}

$\Rightarrow \underline{5}$

③ No. of wires/Cable/Links/ Lines/ Channel/ keys

$$\Rightarrow \left\{ \frac{n \times (n-1)}{2} \right\}$$

OR

$$\left\{ \frac{\text{Total no. of ports}}{2} \right\}$$

$$\text{no. of Links} = \frac{4 \times (4-1)}{2} = \underline{\underline{6}}$$

Q:- In a fully ^{connected} Mesh n/w with 10 computers total — no. of cables are required and — no. of ports are required for each device

{UGC NET CS 2016}

$$\text{no. of ports} \Rightarrow \frac{10 \times 9}{2} \Rightarrow \underline{\underline{45}}$$

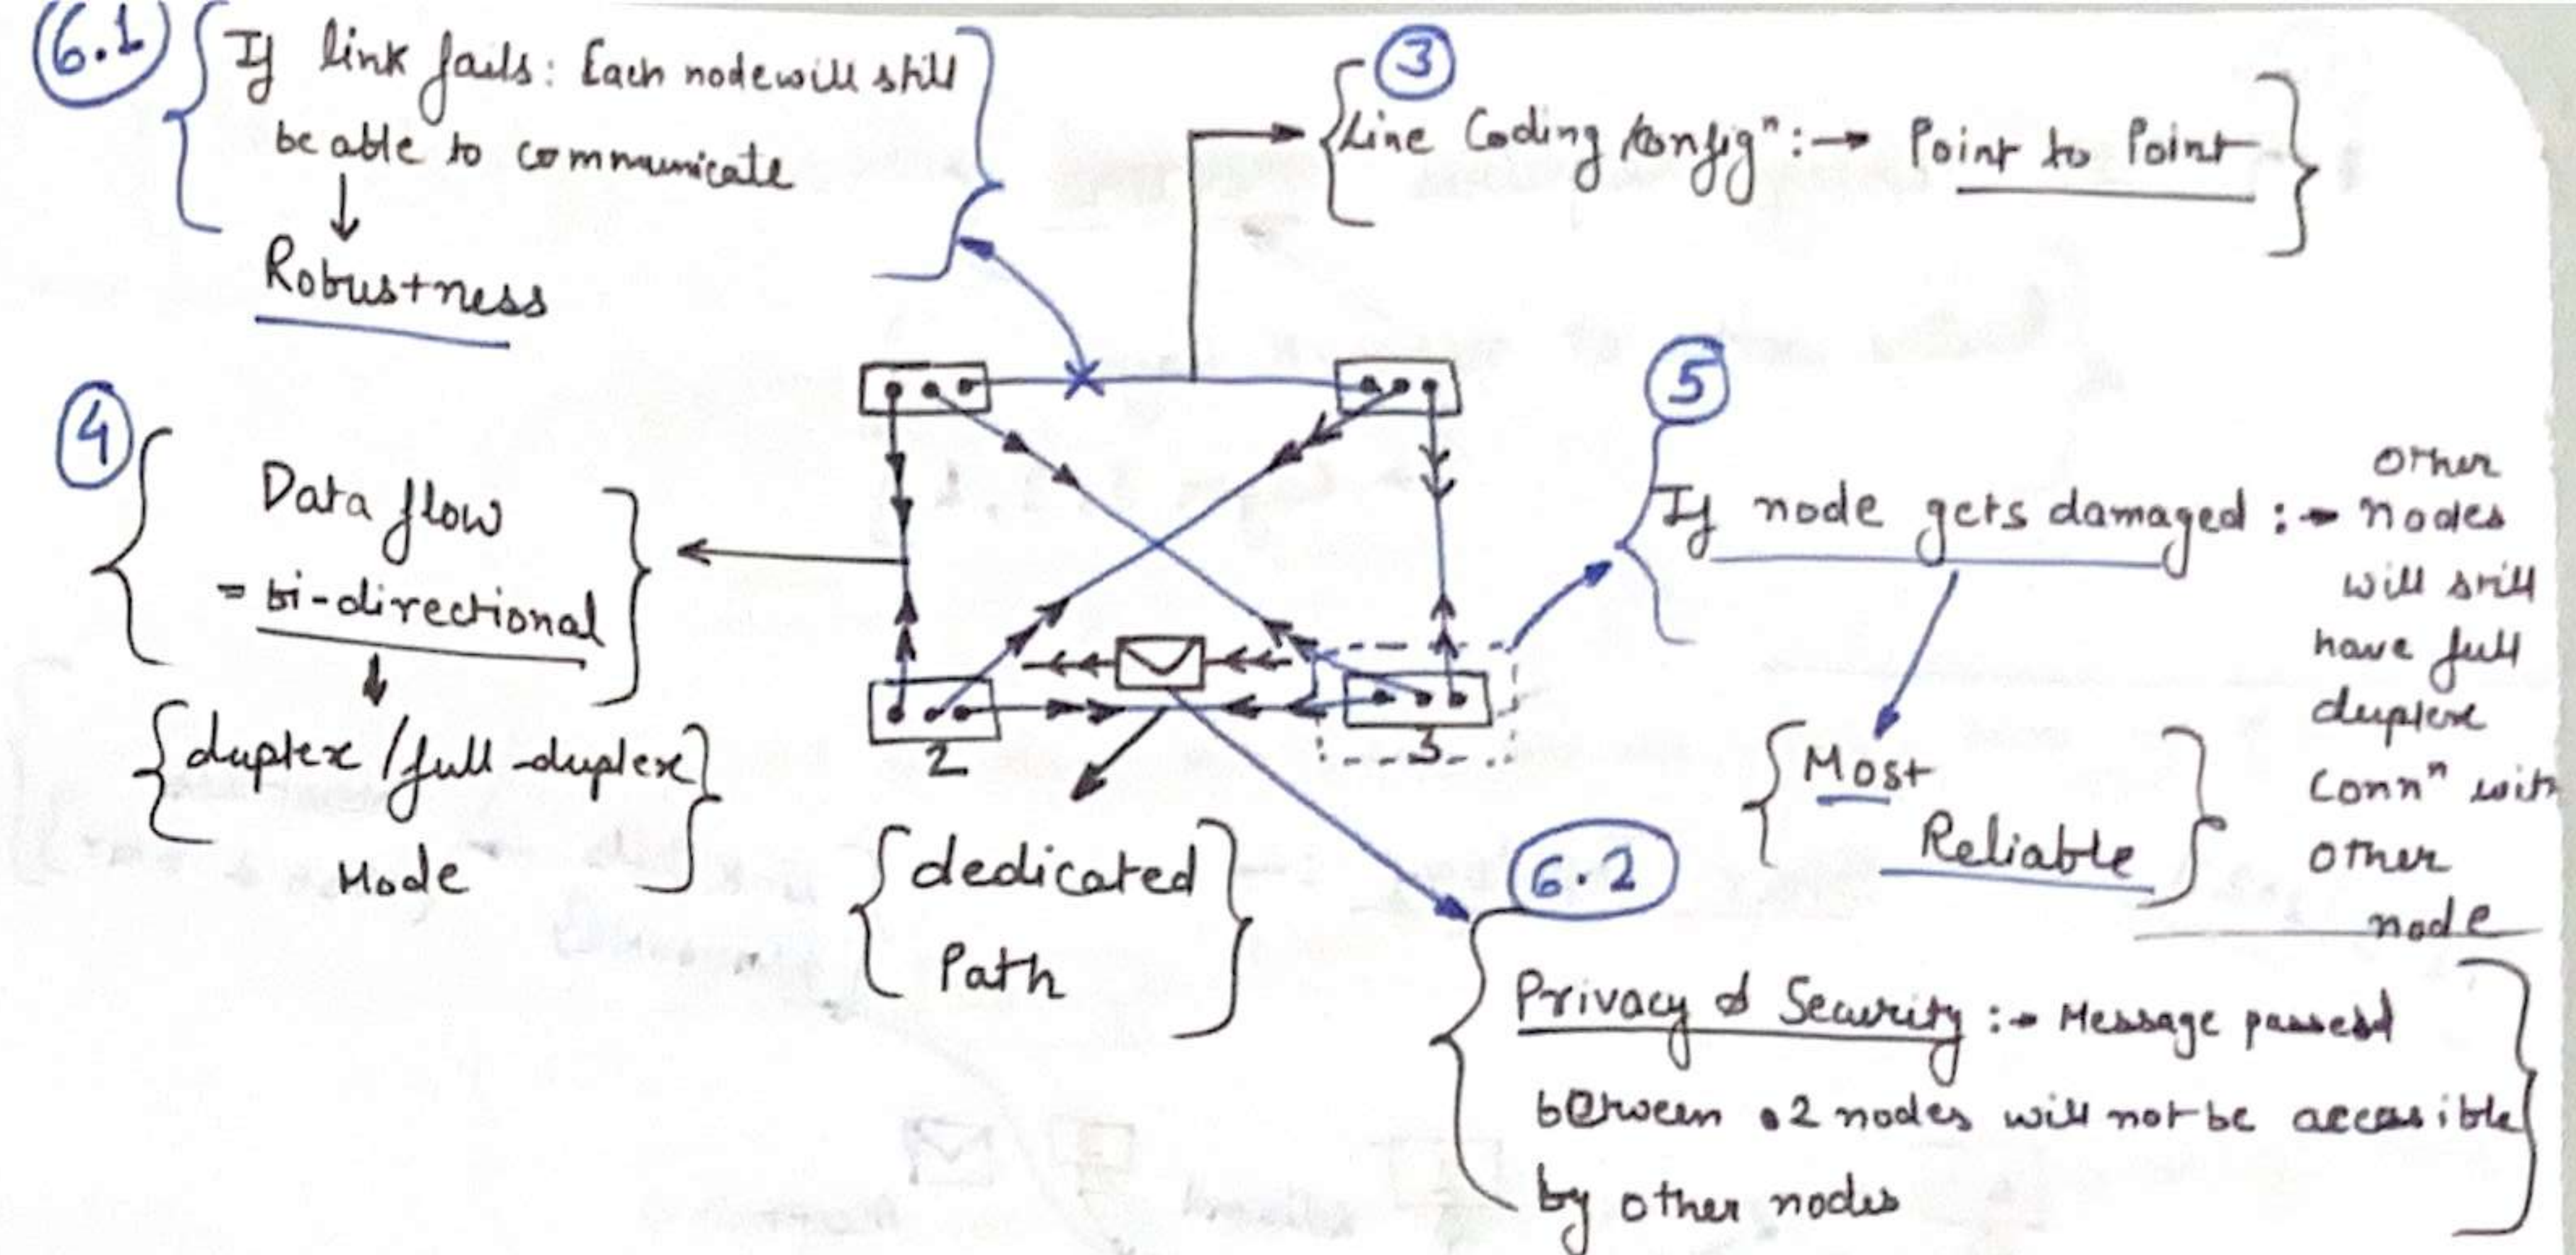

$$\text{no. of ports} \Rightarrow 10-1 = \underline{\underline{9}}$$

for each device

Q:- How many total links are required to connect 10 devices for fully connected mesh n/w?

{BSHCL JEE Electrical 2019}

$$\Rightarrow \underline{\underline{45}}$$

dedicated channel

{eliminates traffic Problem}

6.3

7 Mesh topology provides peer to peer Connection

8 {Fault Identification is easy}

9 Disadvantages :-

— Requires most amount of wiring {Bulk wiring}
expensive: wiring, no. of ports, installation

{Extra :- Amount of wiring :-
Mesh Top. > Star Top. > Bus / Ring Top.
{Most} {Least}}

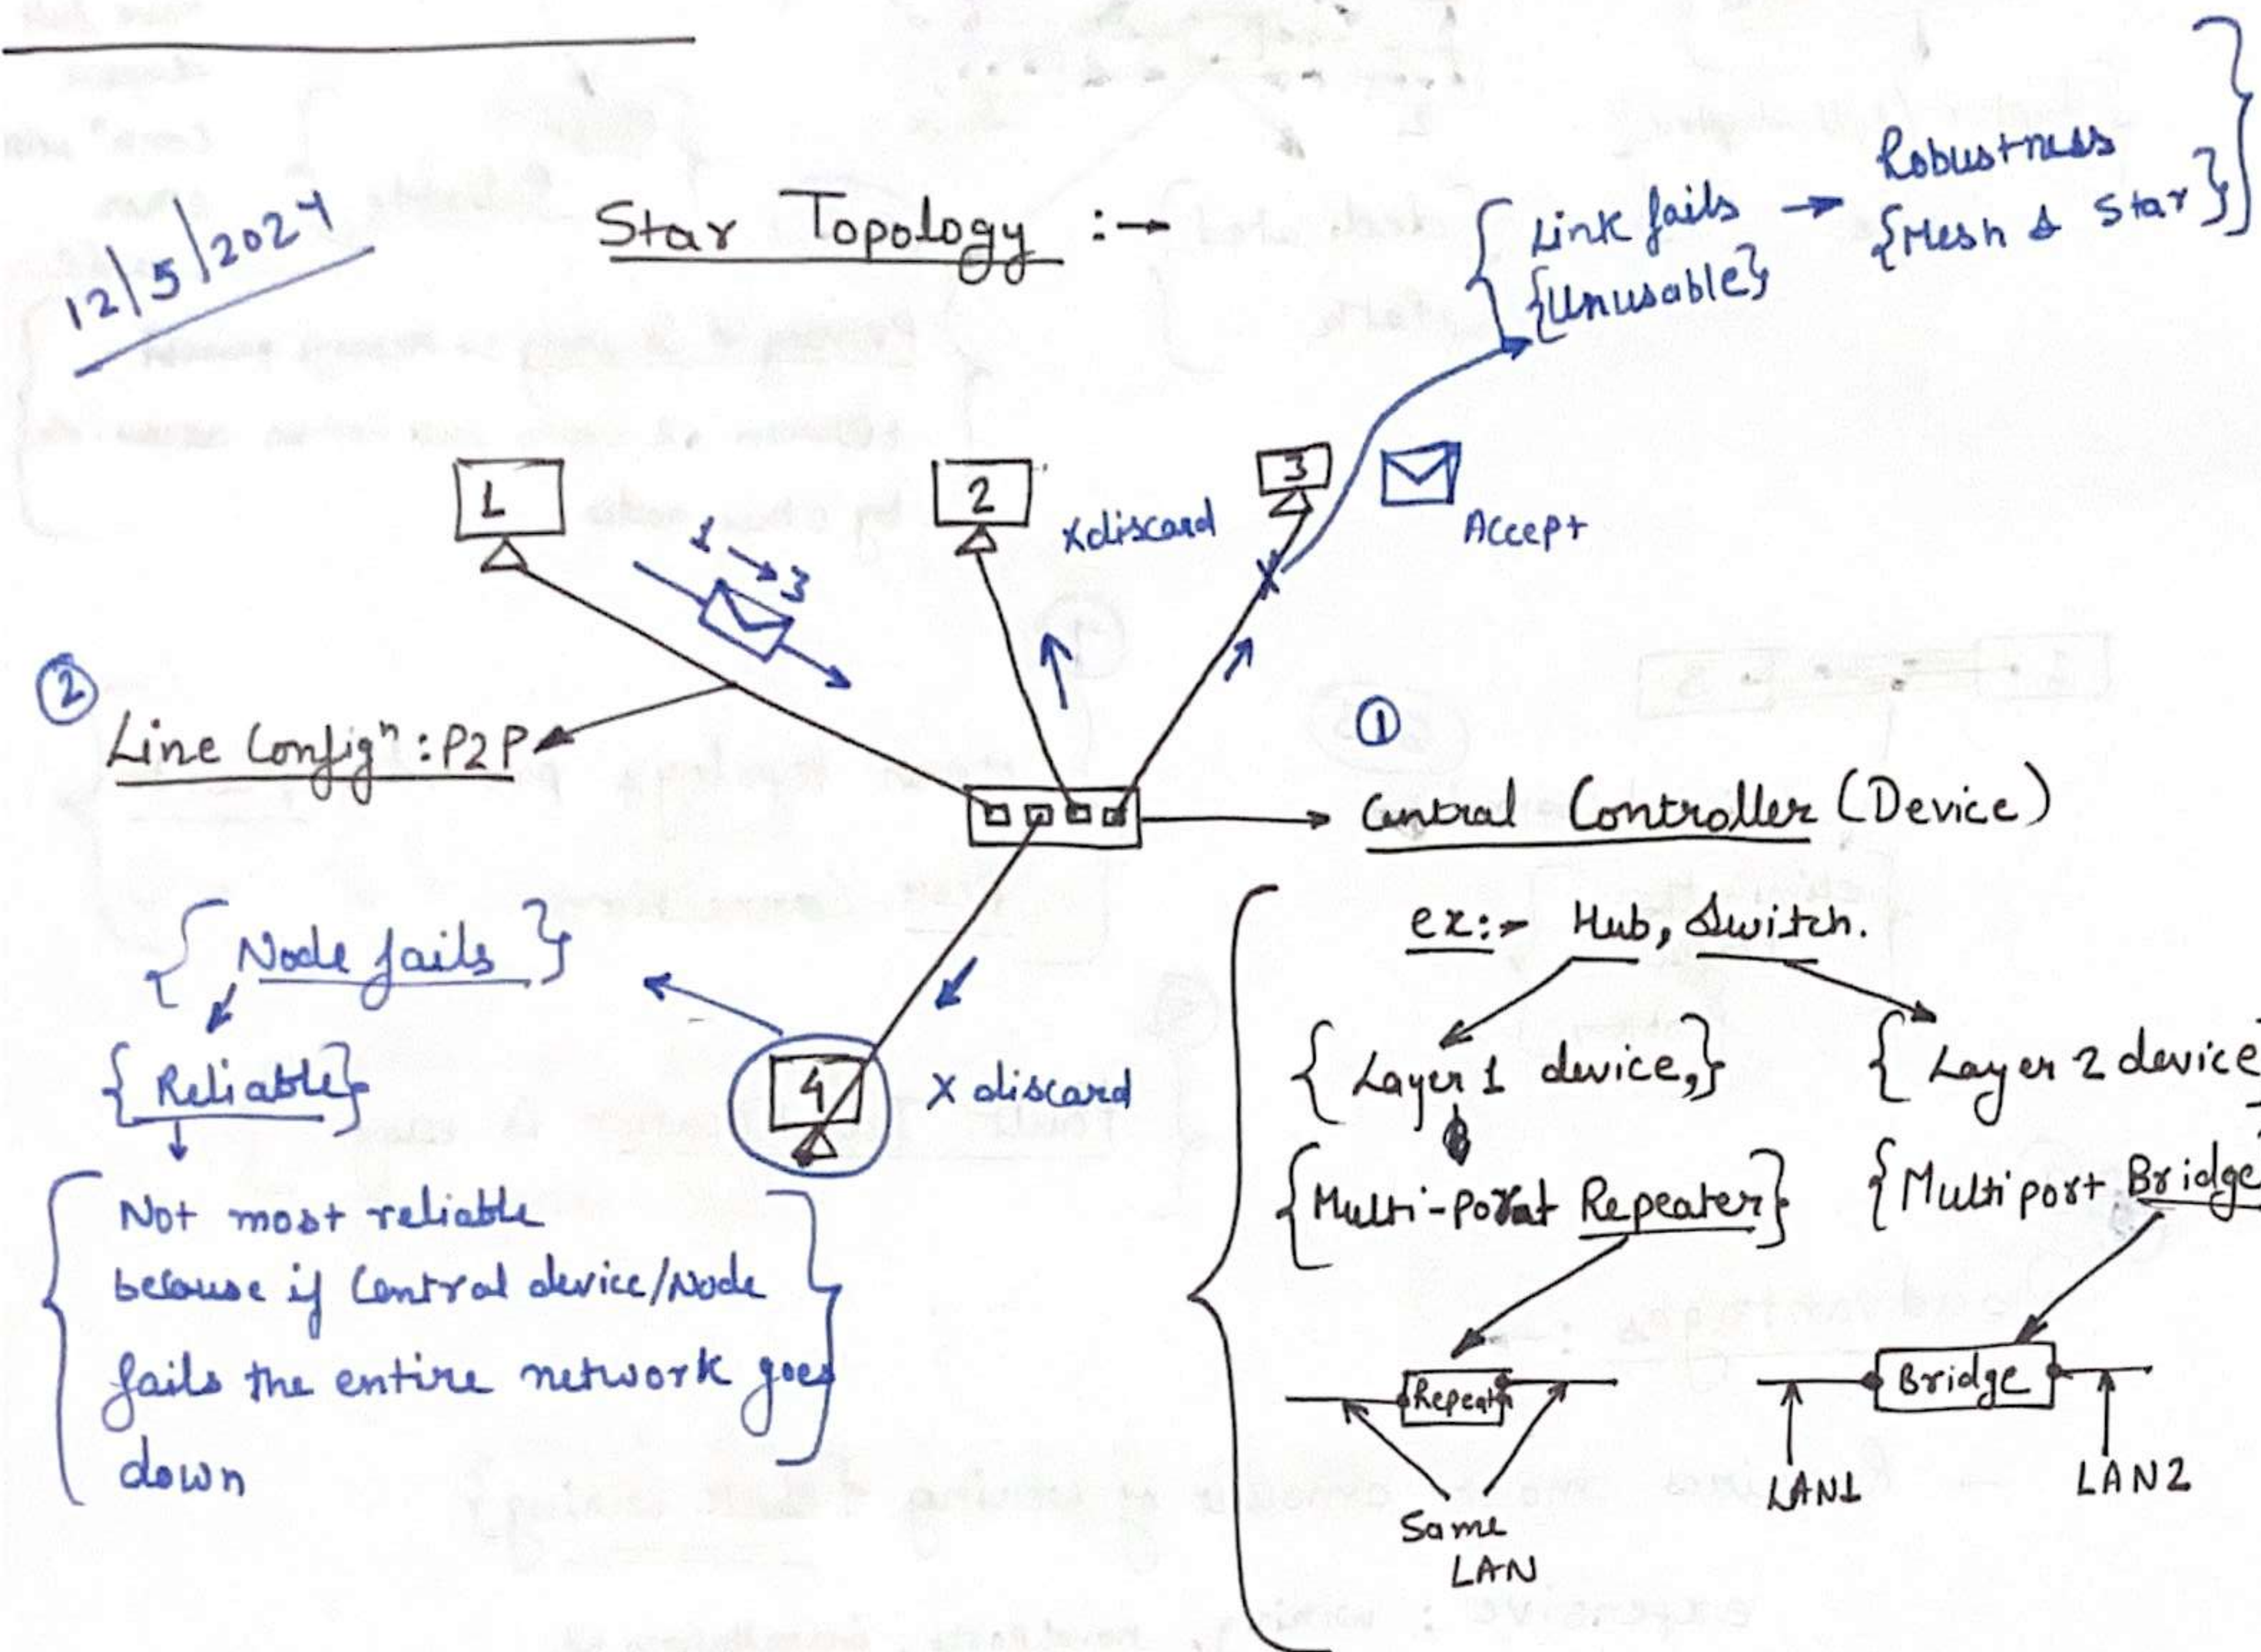

10 Advantage :-

— Mesh topology is used in WAN or internet or wireless network
— Used in telephone regional offices.
— Used in smart buildings & HVAC System
{Heating Ventilation & Conditioning}

- ⑪ Mesh Topology requires Routers
- { Routers works at network Layer
→ Layer 3, 2, 1 }

12/5/2024

Star Topology :-

No. of wires in Star Topology → $(n-1)$ { devices including hub/Central Controller }

{ If $(n-1)$ is not there in option then n wires }

No. of I/O ports on each device: → 1

{ Star Topology requires less wires $\{n-1\}$ than Mesh Topology $\frac{n \times (n-1)}{2}$ }

Extra: →

Bridge used to connect two LANs that are working same type of N/w

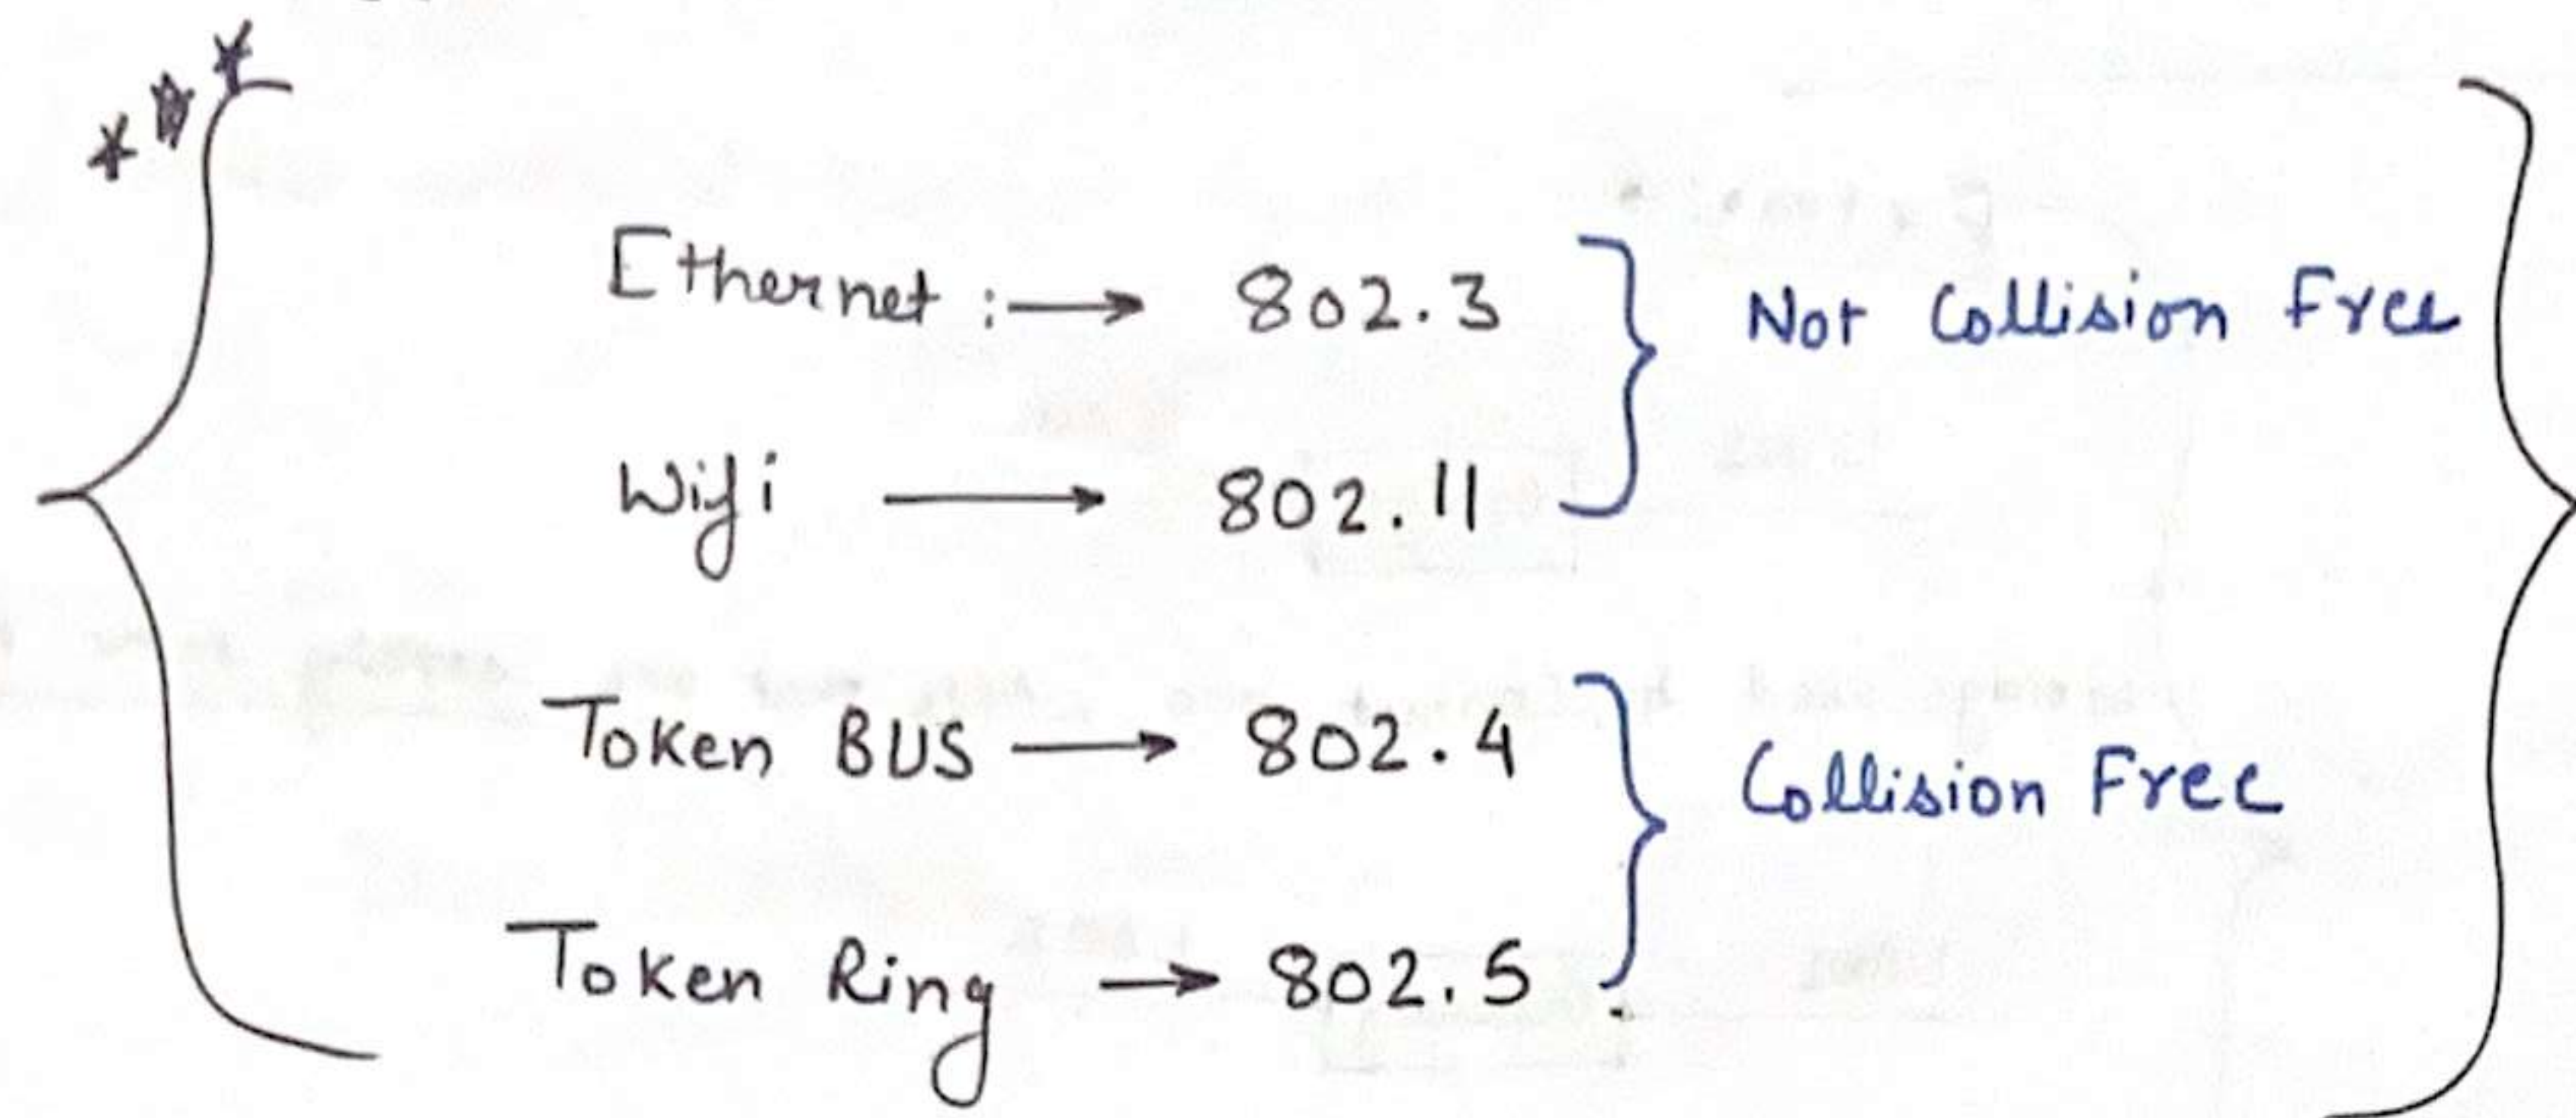

Gateway is used to connect dissimilar n/w / n/w with diffⁿ protocol

- ① In Star Topology a Central Controller or device is used
- ② Star Topology provides P2P Configⁿ
- ③ In Star Topology, no. of wires = $(n-1)$ { or if option doesn't have $(n-1)$ then (n) }
- ④ No. of I/O ports on each node = 1
- ⑤ Star Topology requires less wire than Mesh.
- ⑥ Single Point Dependency: → If the central controller fails then entire networks goes down
- ⑦ Robustness: → if a link fails then also n/w or system will work efficiently.

⑧ Common LAN Topology: → Star, Ring & Bus

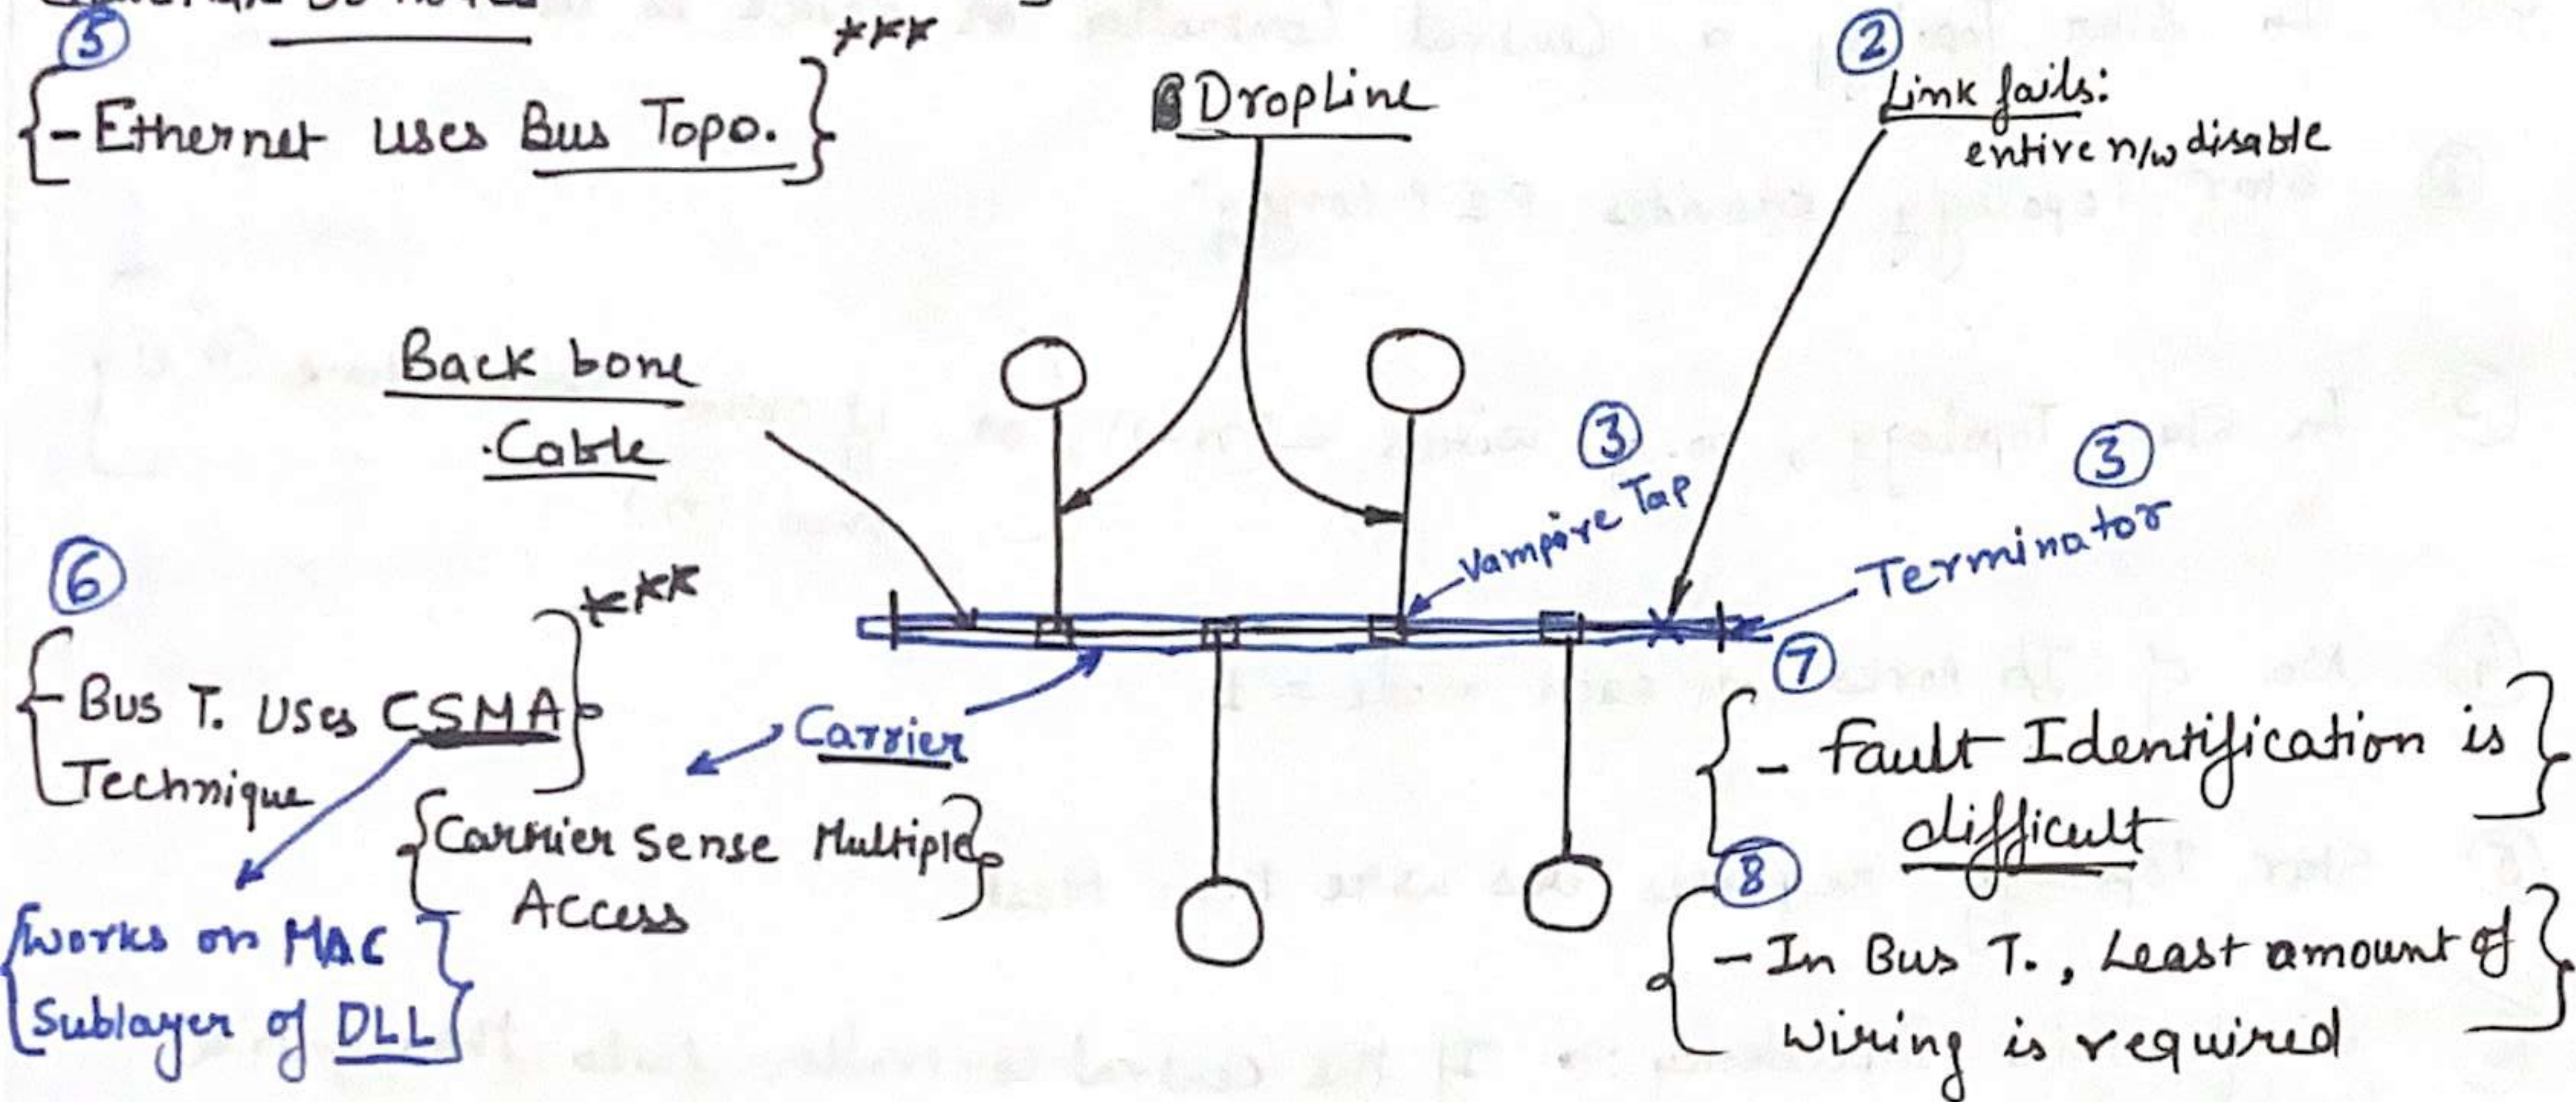

Ethernet (IEEE-802.3) → Not collision free
{ is a standard of LAN }

⑨ Star Topology : → is used in Banks.

Bus Topology

- ④ - In Bus Topology we have Multipoint Configuration.
- According to IEEE, Bus Topo. should have Max 30 nodes
- ⑤ - Ethernet uses Bus Topo.

- ⑥ Bus T. Uses CSMA Technique
- Carrier Sense Multiple Access
- Works on MAC Sublayer of DLL

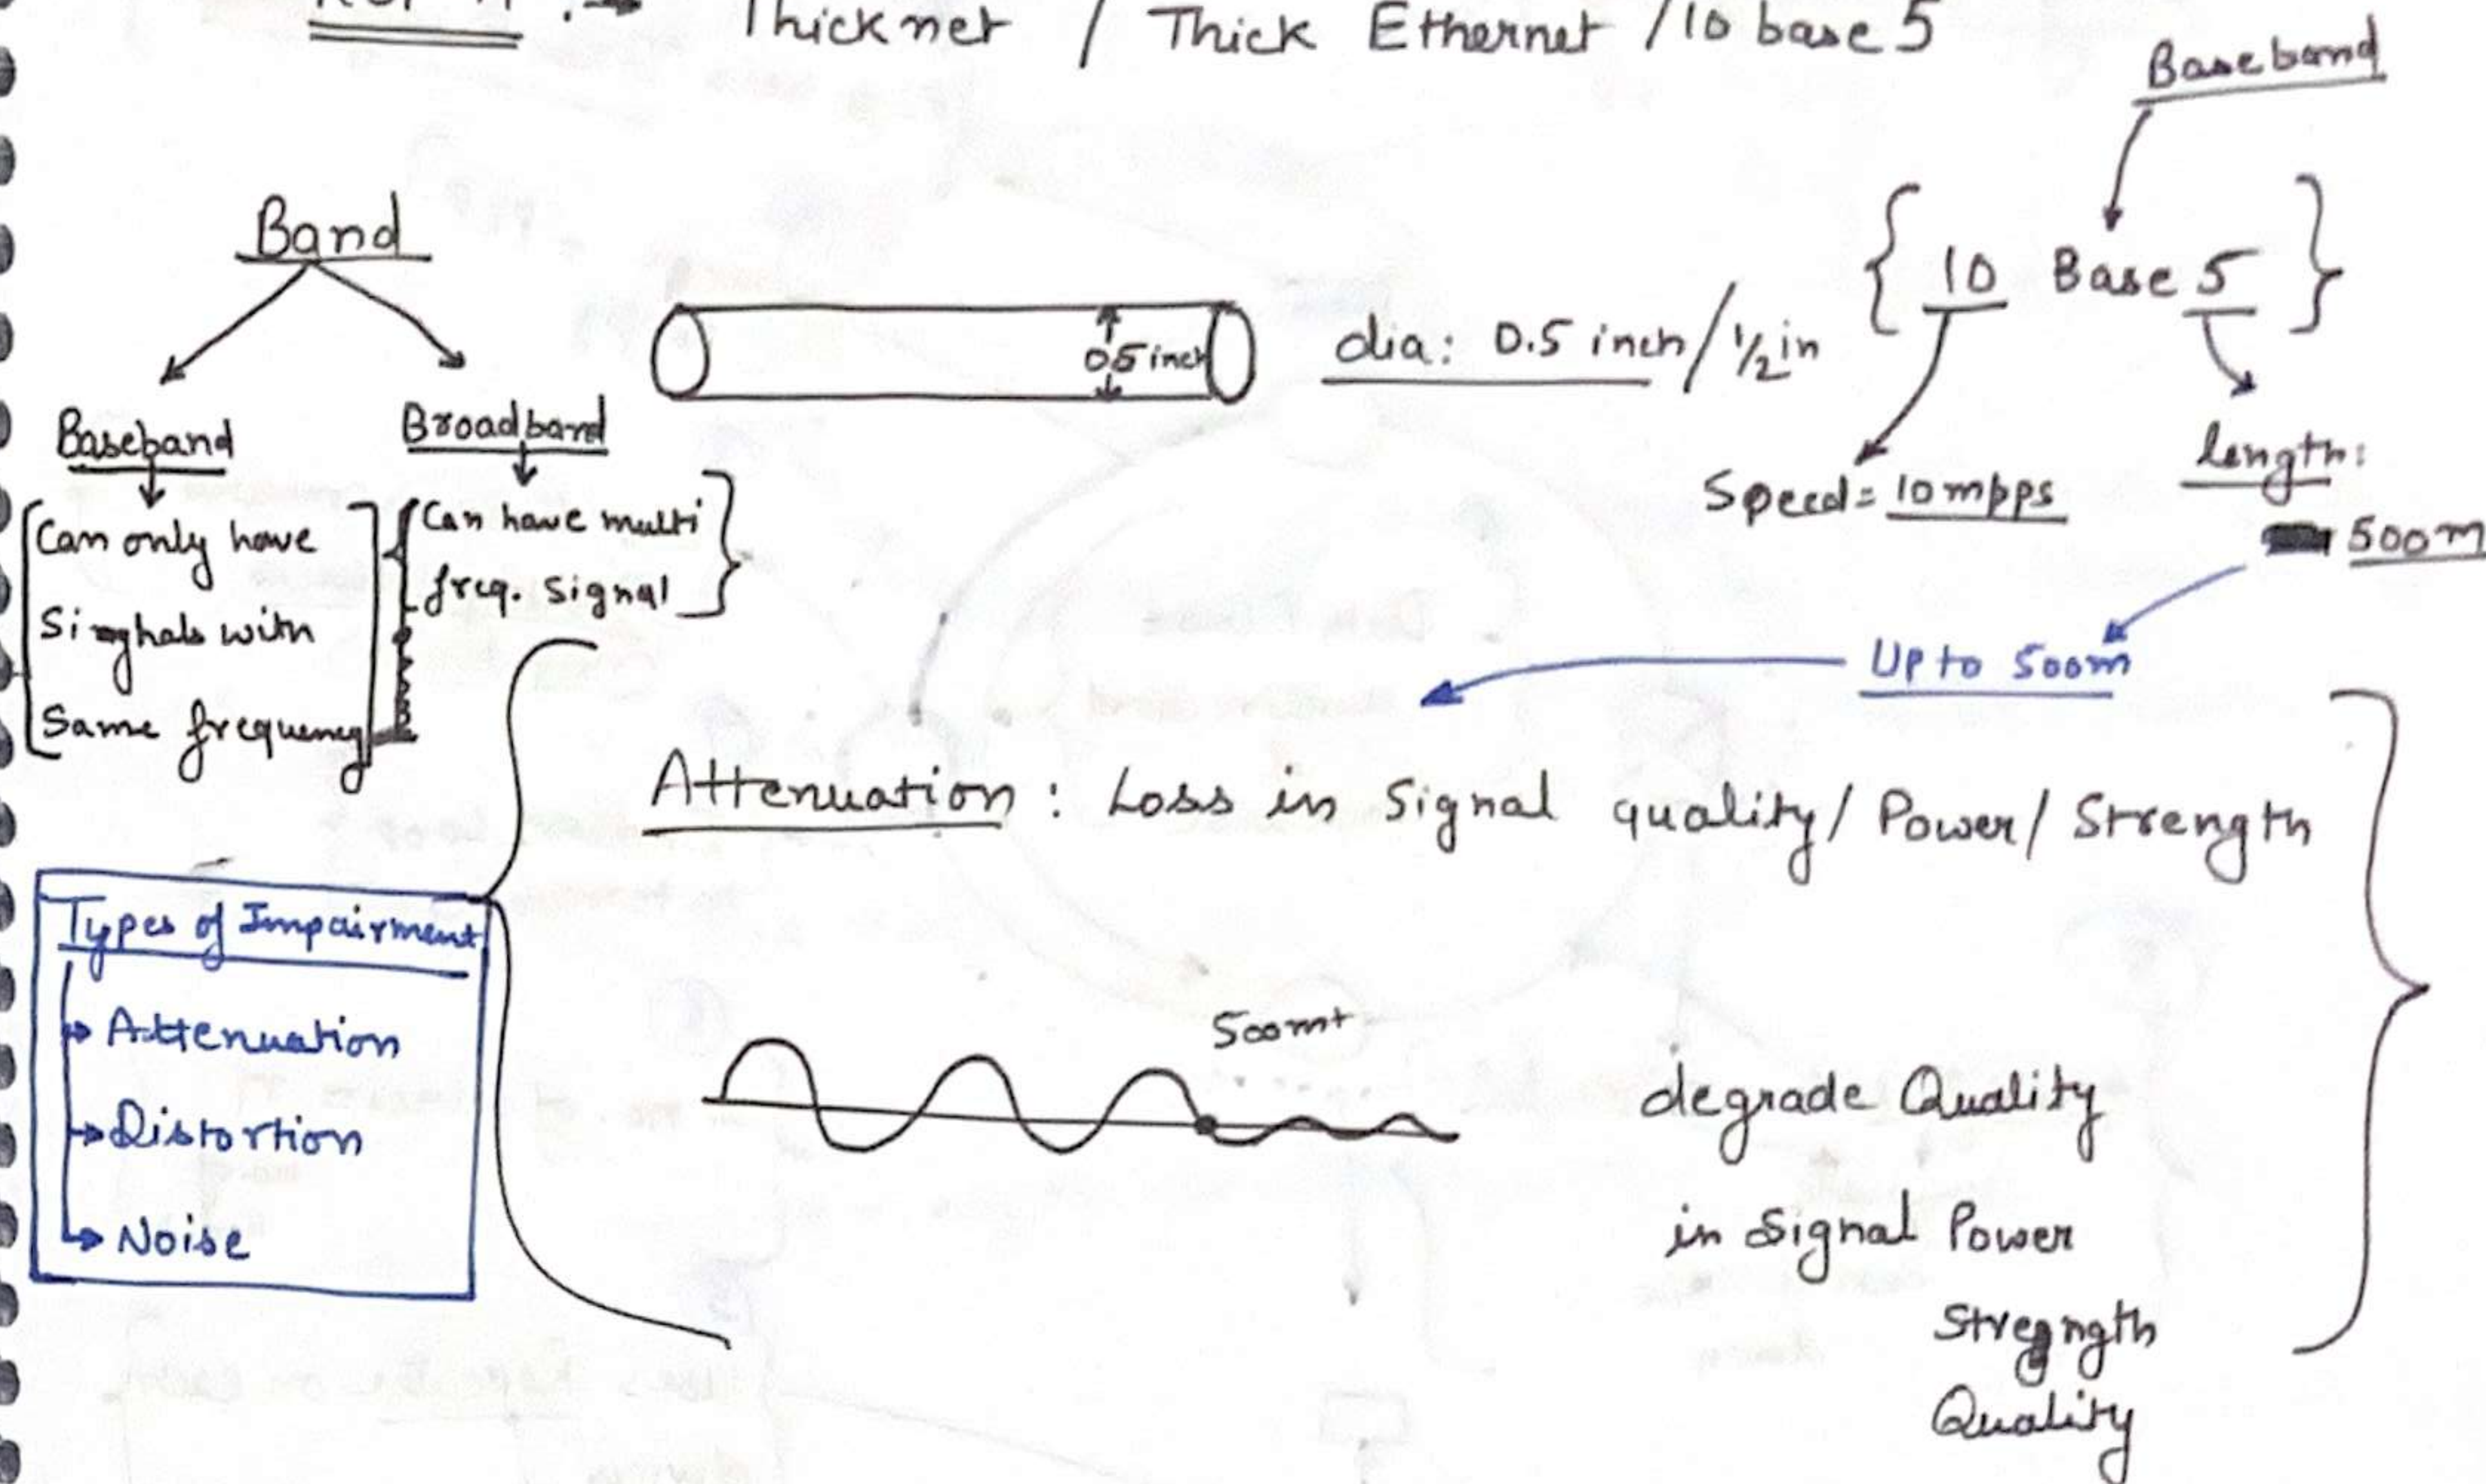

Earlier for Bus topology, we used to use Coaxial Cable {Thick headed coax}

Coaxial Cable : → Developed in : → 1858 by Oliver Heavy side

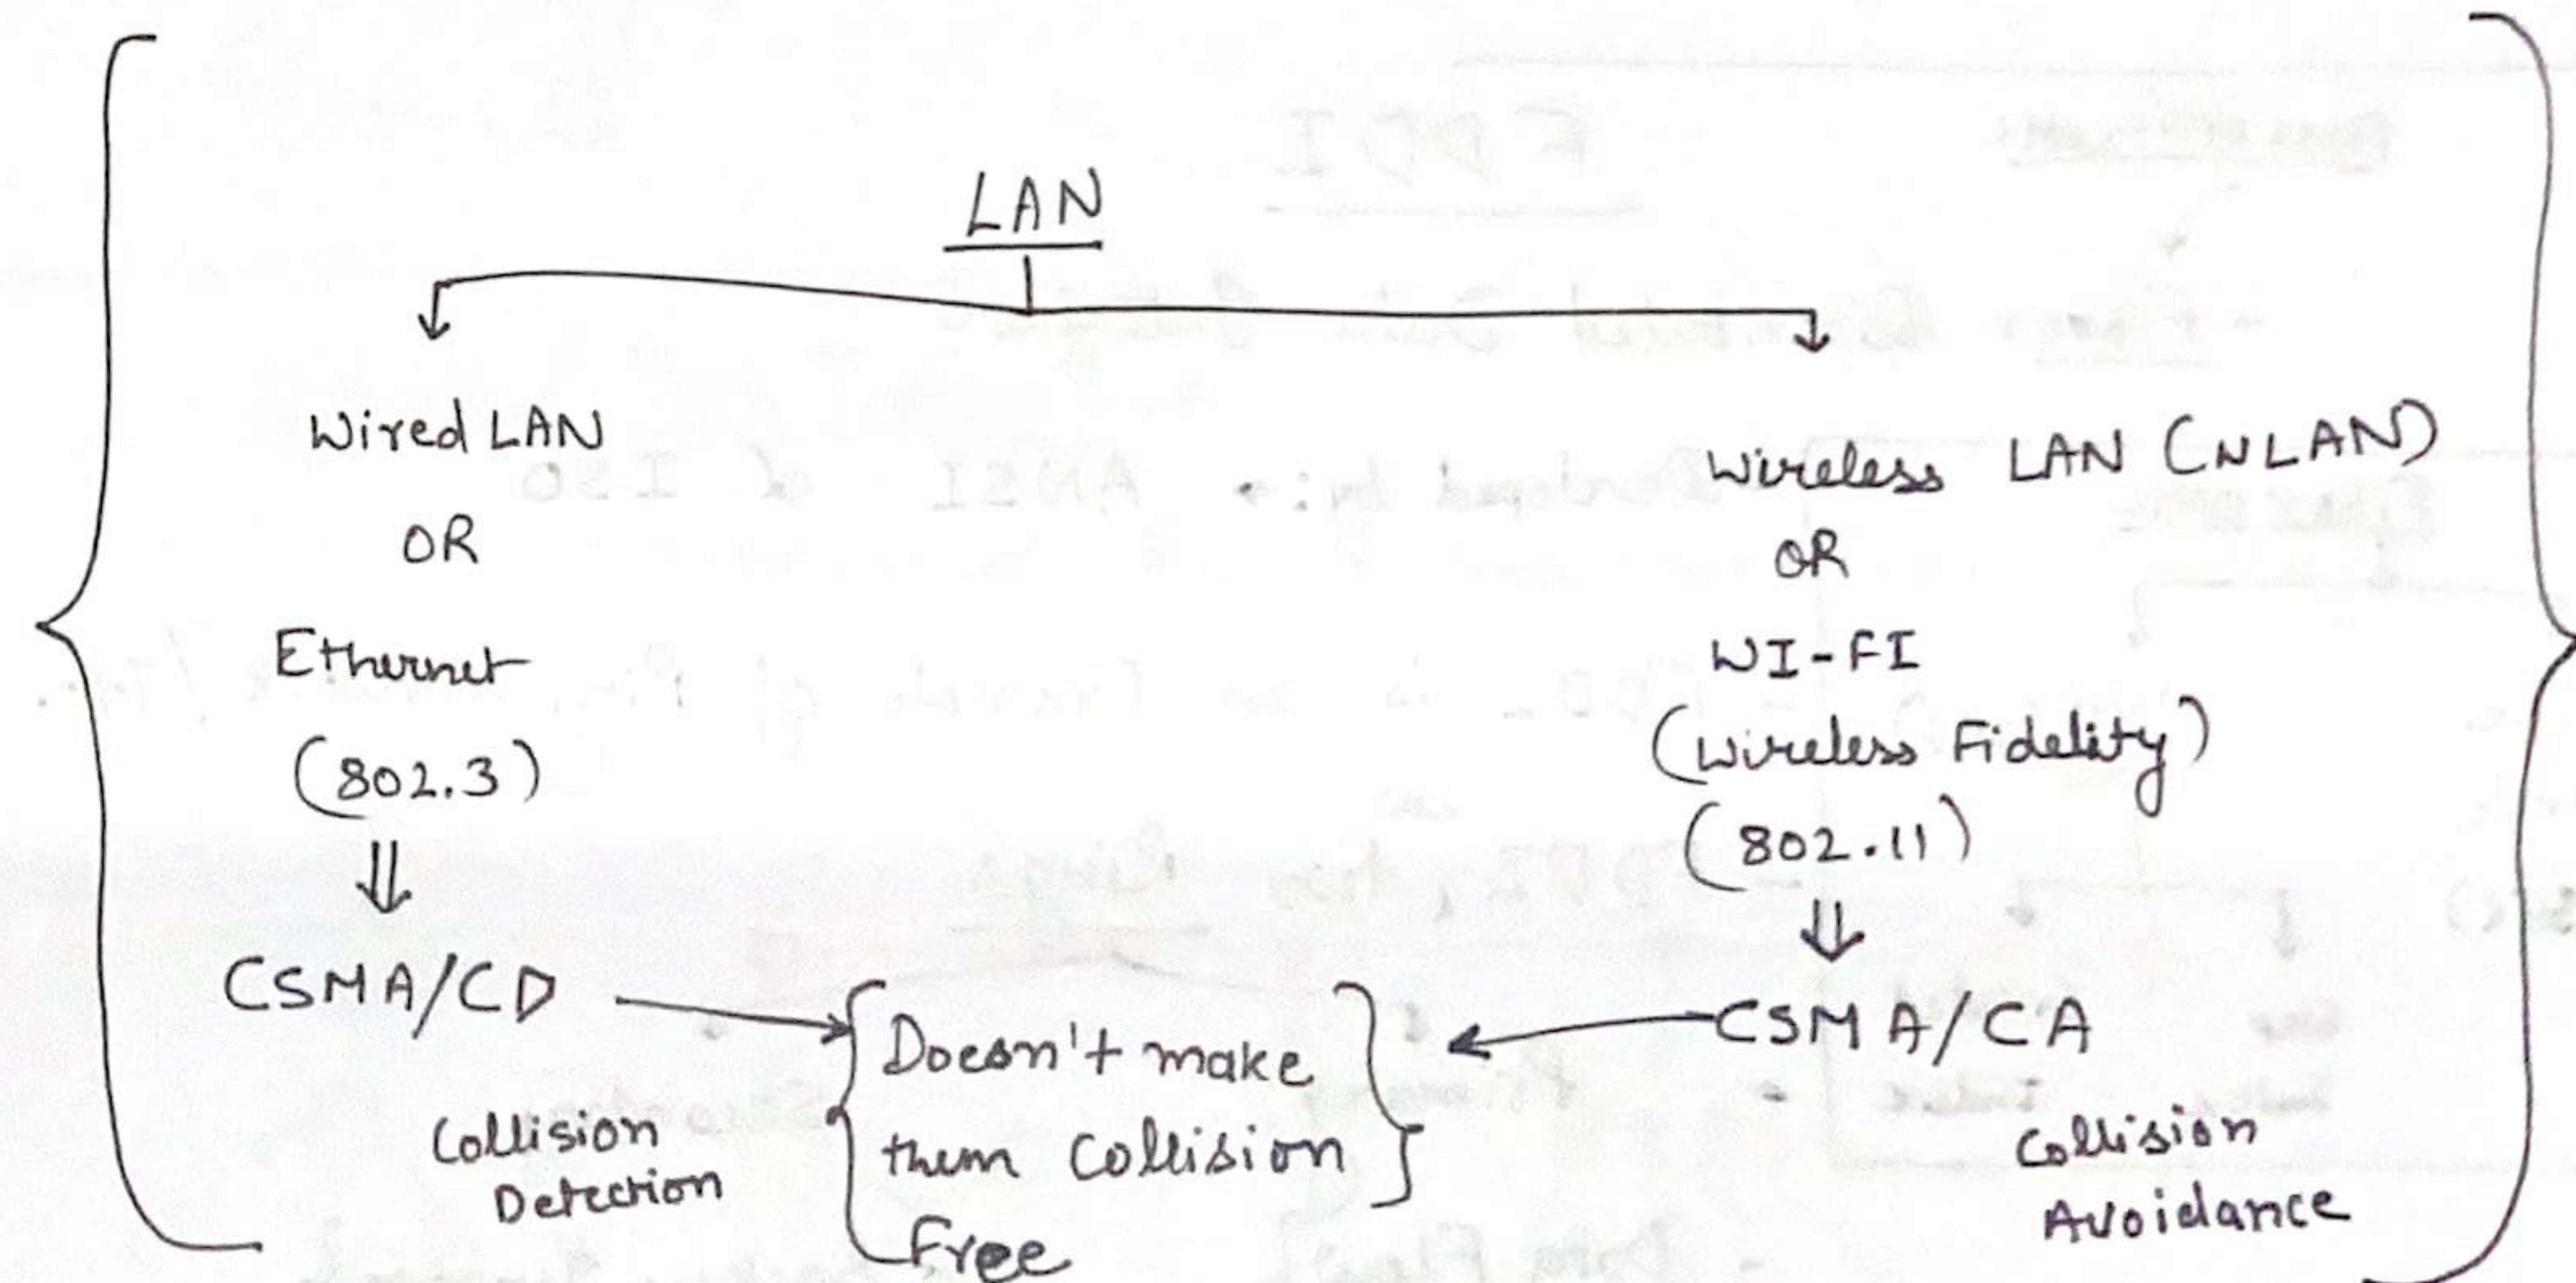

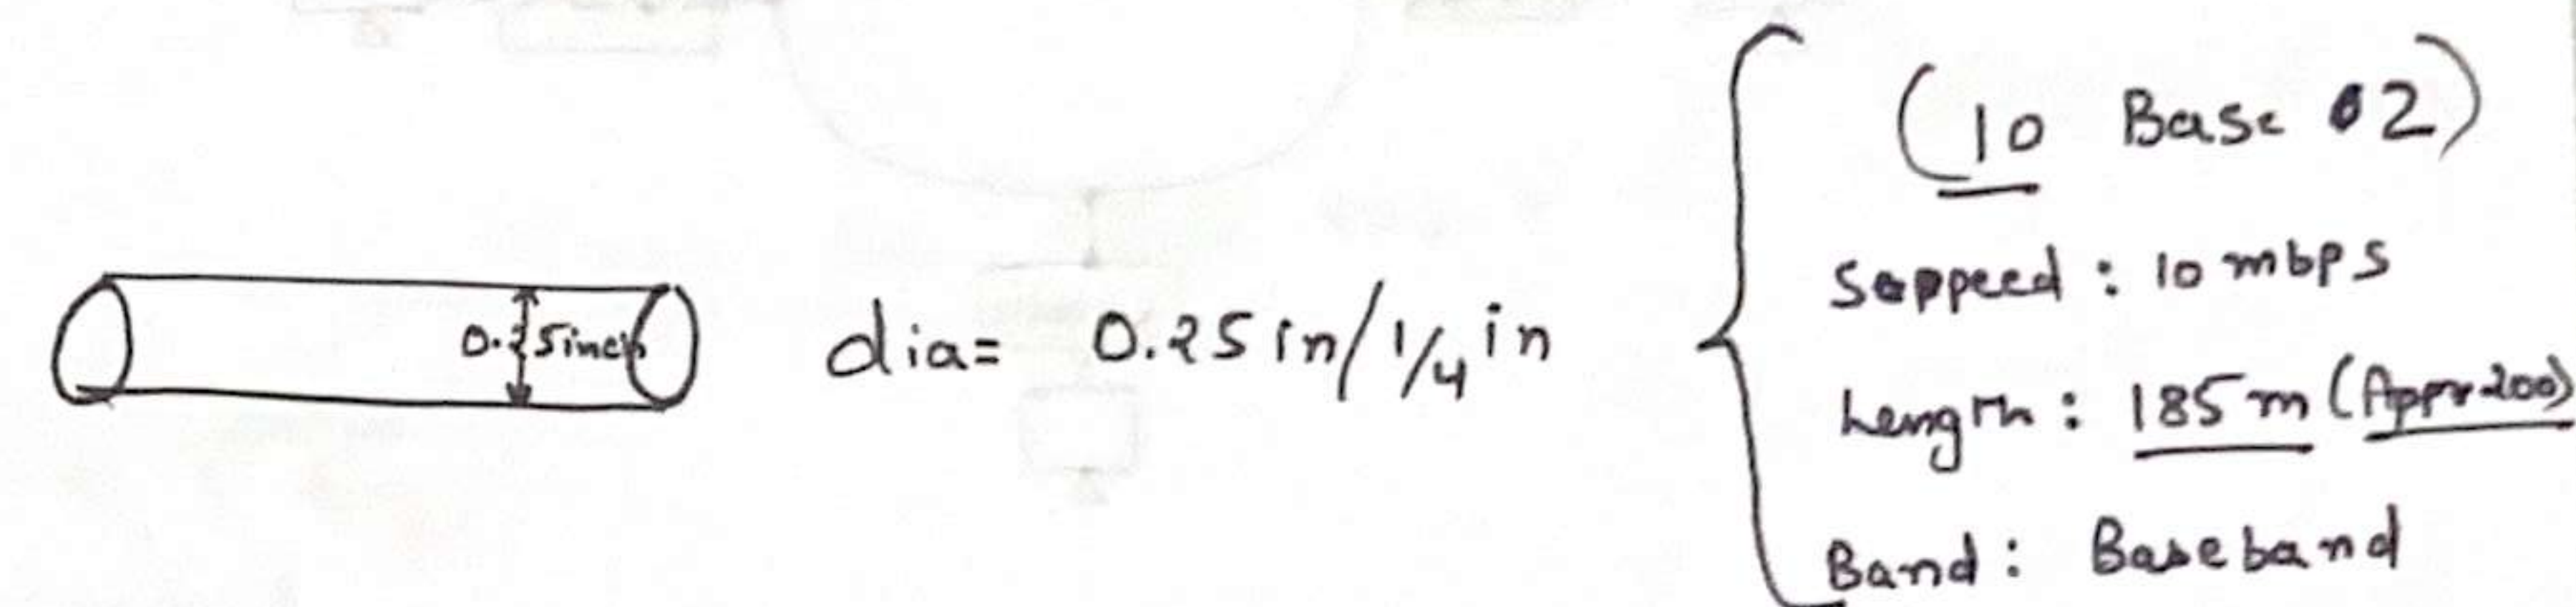

Category	Use	Impedance
RG-11	Early Ethernet	50 Ω
RG-58		50 Ω
RG-59	Cable TV	75 Ω

Radio Government OR Radio Guide

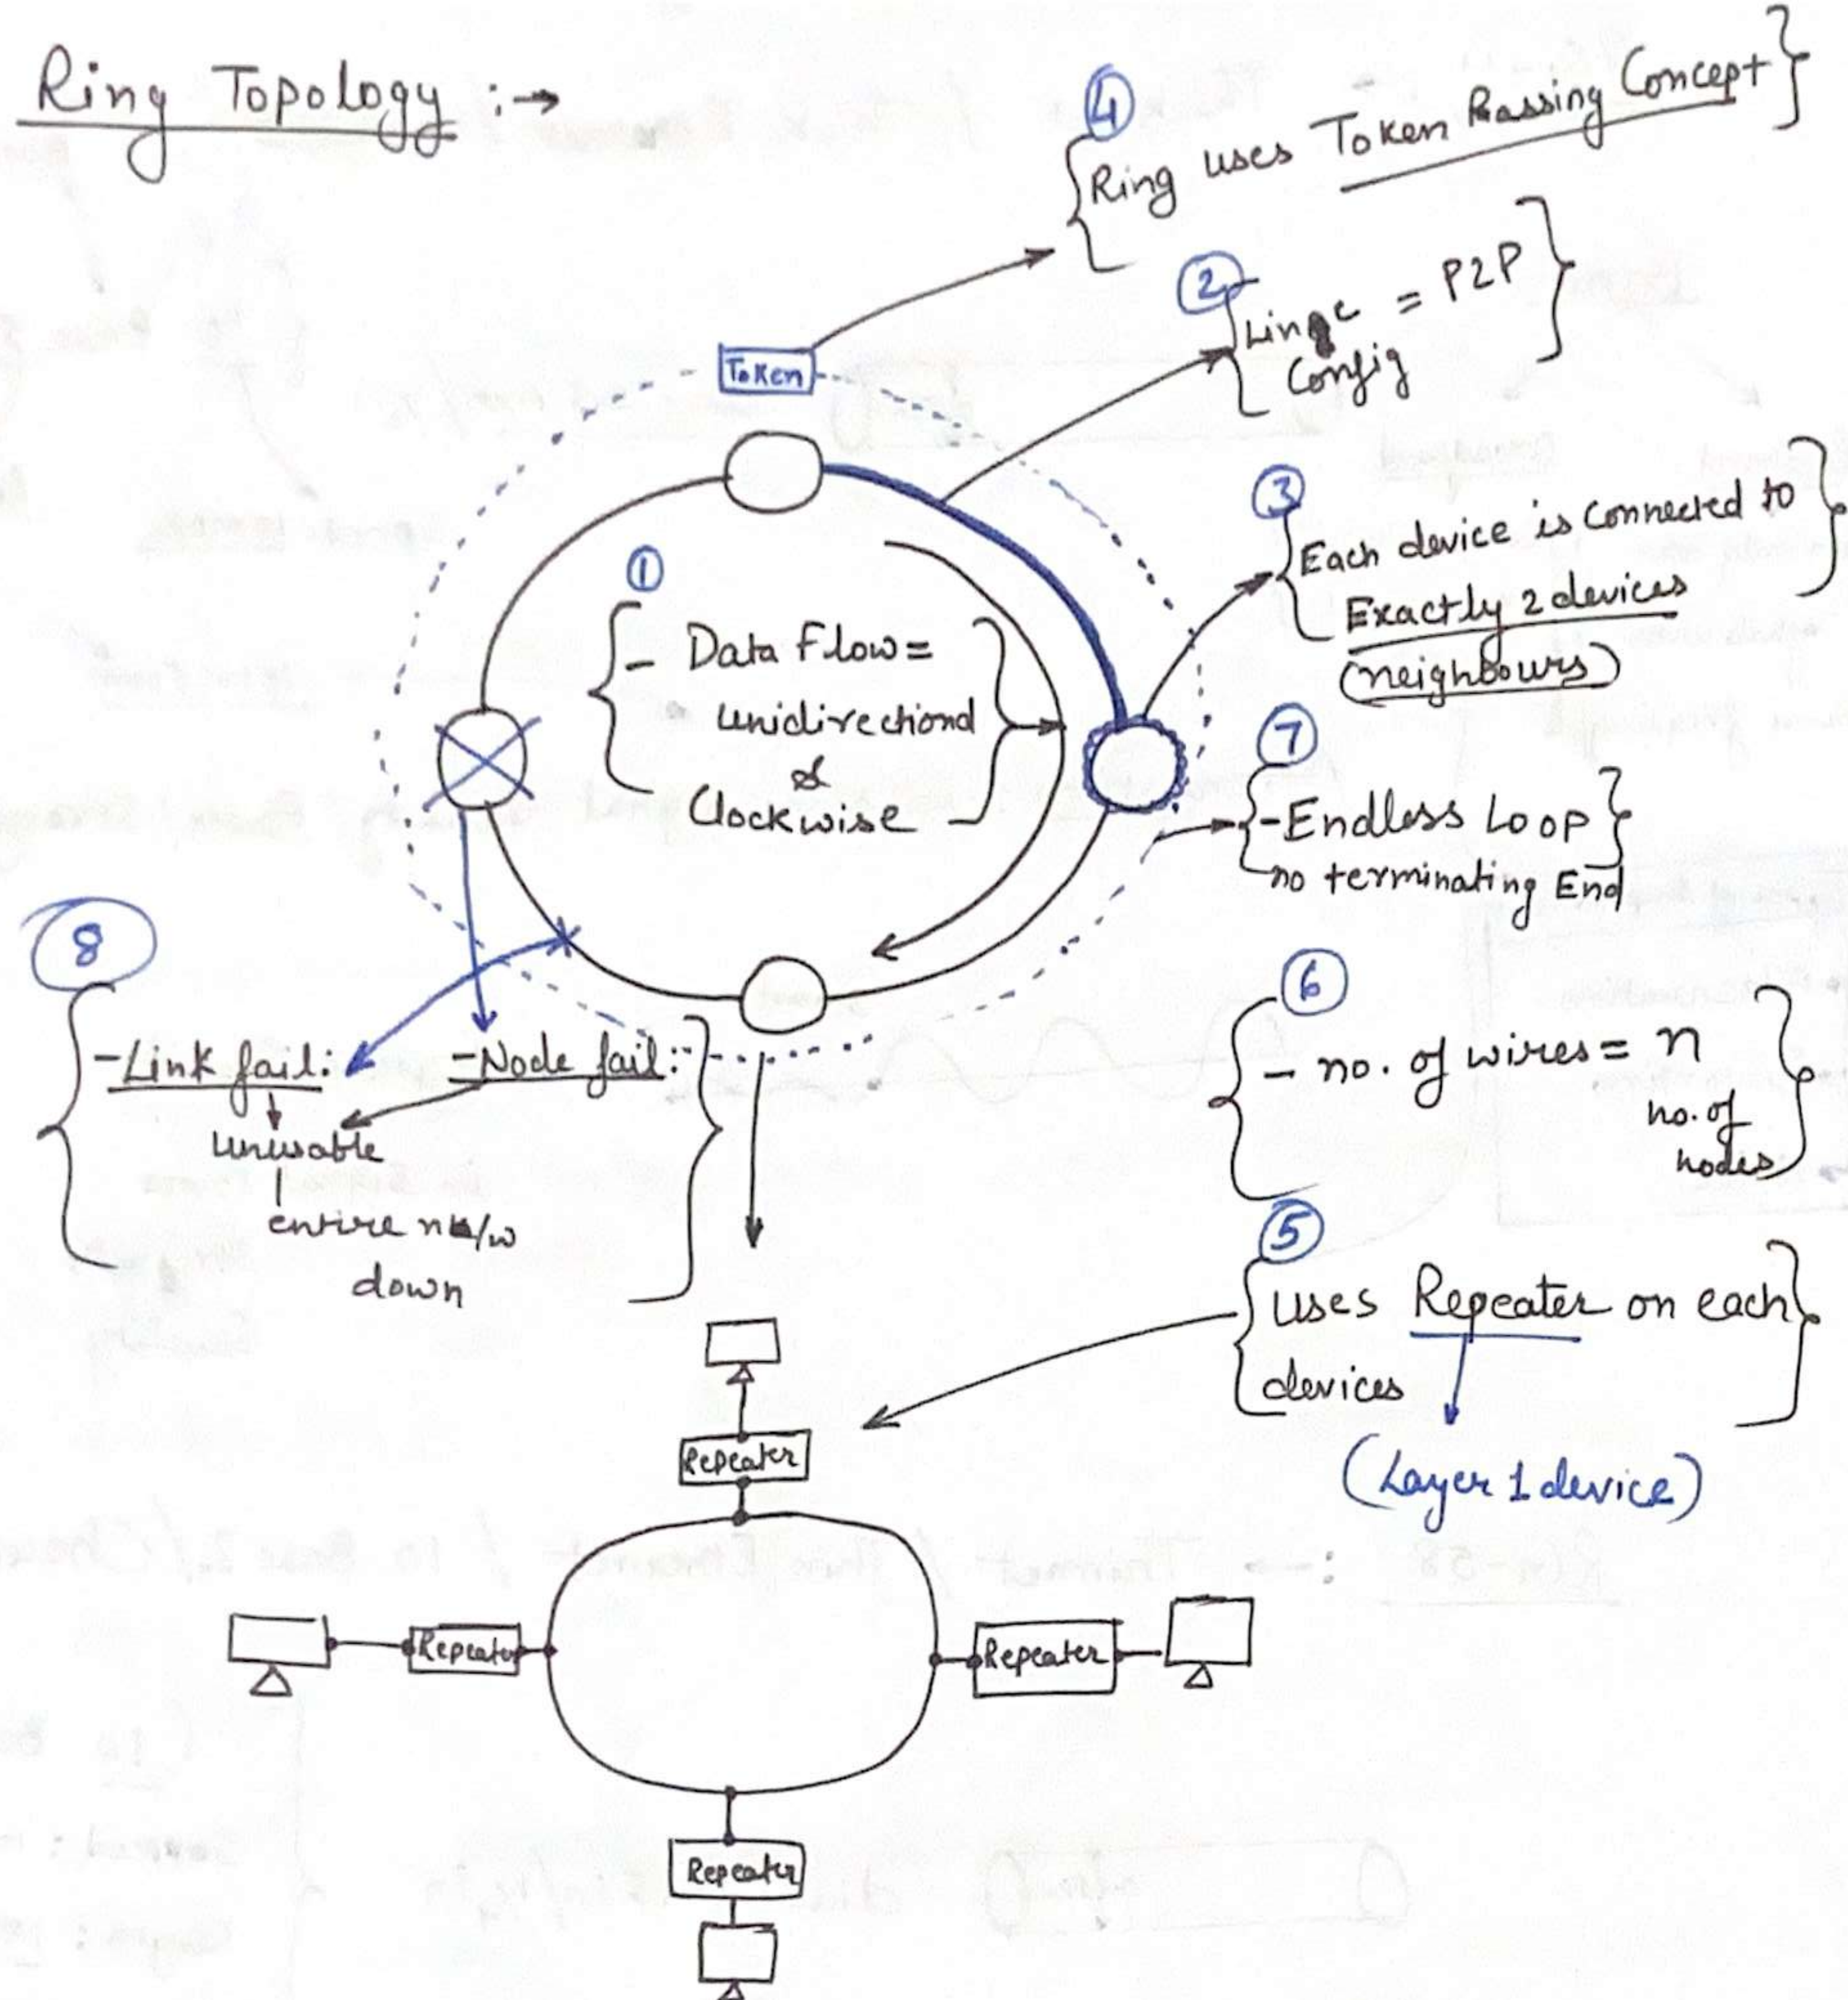

RG-11 : → Thicknet / Thick Ethernet / 10 base 5

RG-58 : → Thinnet / Thin Ethernet / 10 Base 2 / Cheapnet

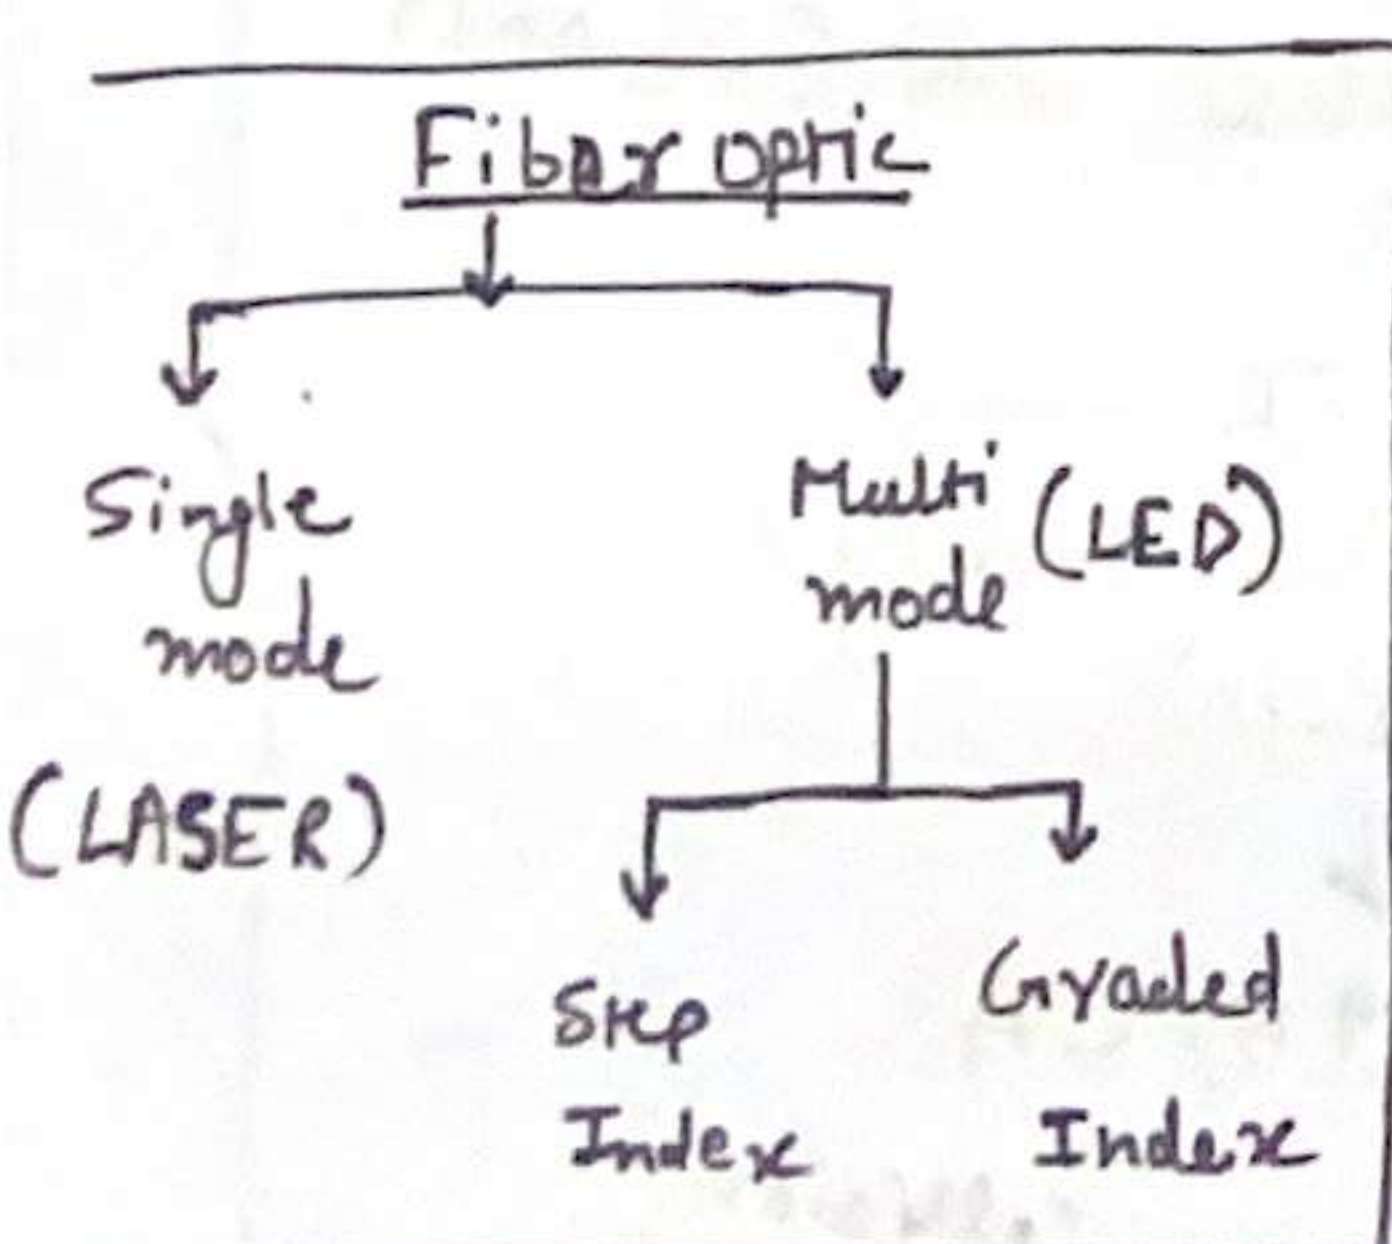

Ring Topology :-

Fiber Optic Cable

FDDI

- Fiber Distributed Data Interface

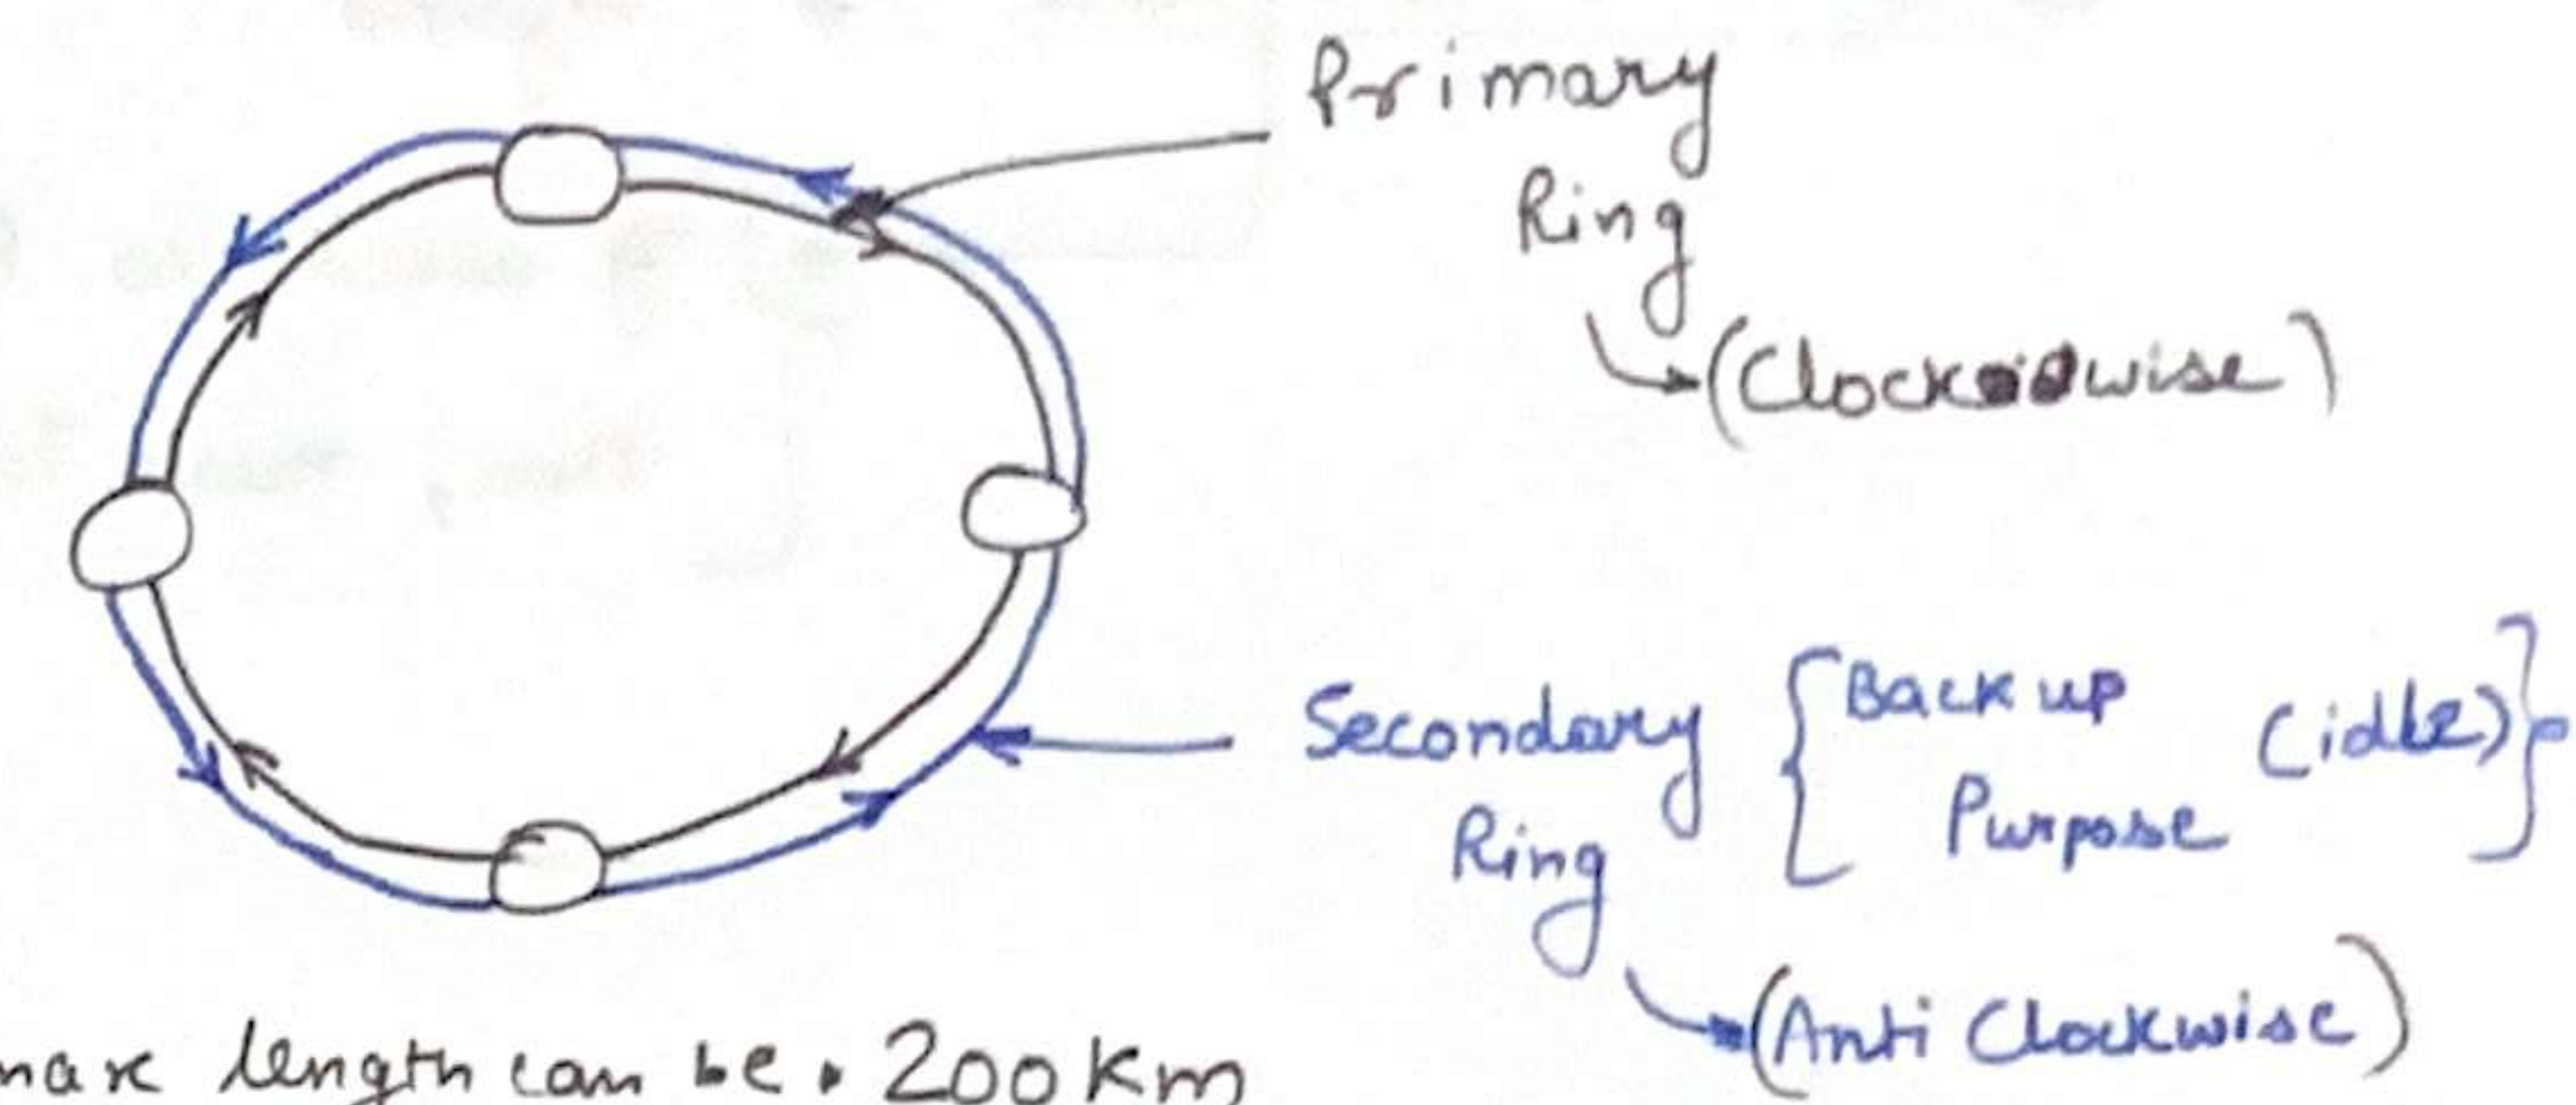

- Developed by: ANSI & ISO

- FDDI is an Example of Ring Network / Topo.

- FDDI has two Rings

FDDI :-

- In FDDI n/w, max length can be 200 Km

- In FDDI n/w, max nodes: 1000

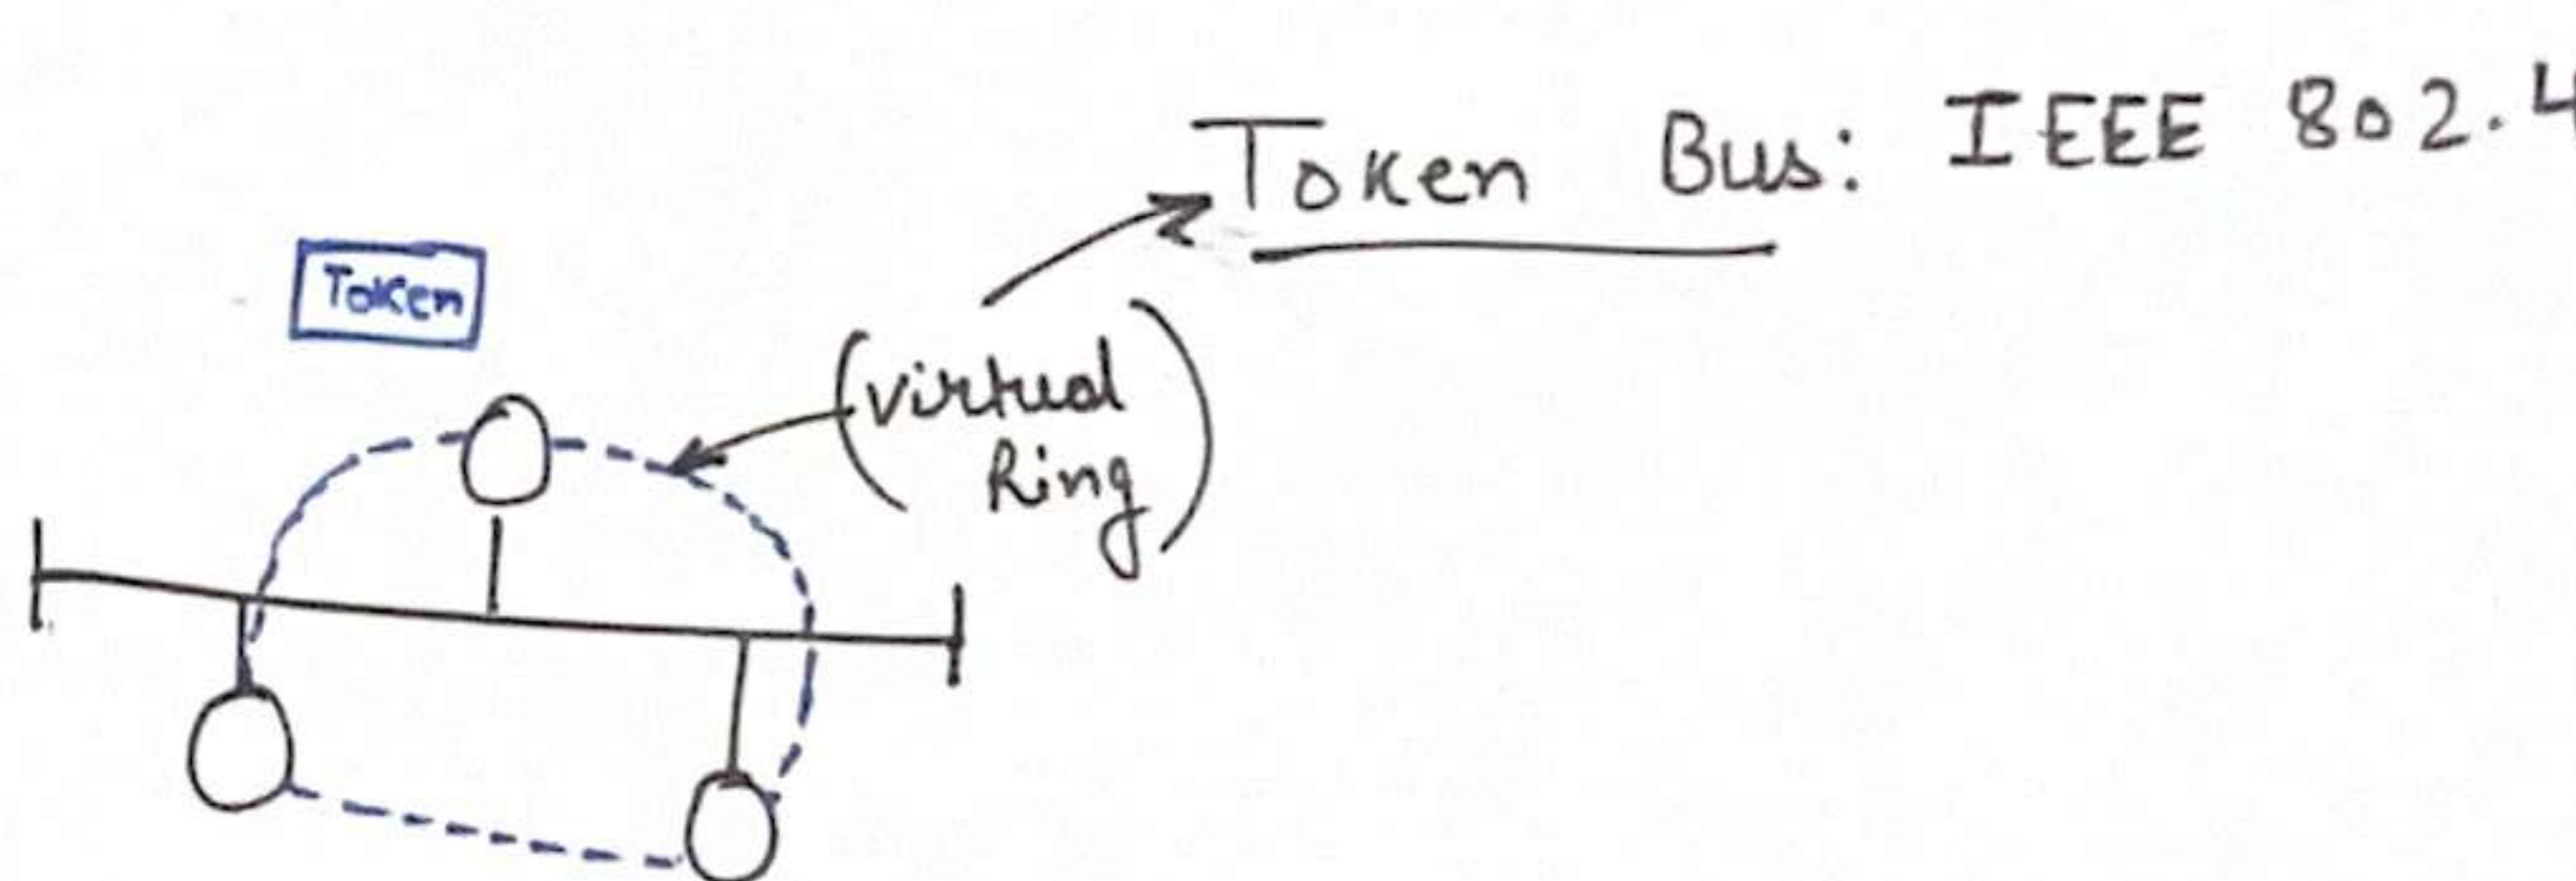

At a time only one node will have Token

Token Ring: IEEE 802.5

- Works at DLL {MAC Sublayer}

- Collision Free

Token Bus: IEEE 802.4

Hybrid / Tree Topology :-

- Combination of Bus & ~~Tree~~ Star Topo. {Generally}

- Combination of 2 or more

- Complex Architecture : \rightarrow Hybrid

{ If asked b/w Bus, Ring, Star, Mesh
then, mesh Topo }
